

Clinical Diagnostic Summary

Patient Information

Name	satyam shamrao jondhale	22
Gender	Male	Brain Tumor

Summary Section

Detection Status	Detected
Tumor Type	pituitary tumor
Stage	Grade IV
Confidence	90%
Tumor Size	Medium (2.90% of scan)

Segmentation Insight

Segmentation Insight: Localized high-intensity lesion detected in MRI scan.

Confidence Interpretation: Model confidence indicates high reliability.

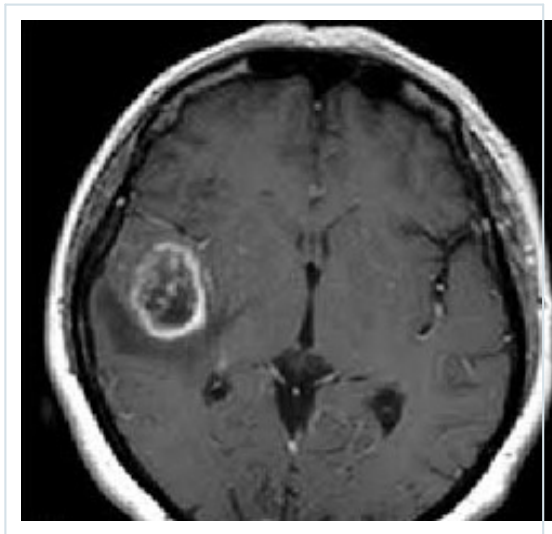

AI Analysis

Detection Status	Detected
Detection Type	Brain Tumor
Tumor Type	pituitary tumor
Stage	Grade IV

Confidence	90%
Model Accuracy	66.67%
Tumor Size	Medium (2.90% of scan)
Segmentation Region	59 x 130 px

Clinical Interpretation

Post-processed segmentation identified a medium focal lesion consistent with pituitary tumor. Tumor occupies 2.90% of the scan area. Clinical and radiological correlation is recommended. Pituitary tumors develop in the pituitary gland and can affect hormone production throughout the body. Recommended action: Surgery, radiation therapy, medication to control hormone levels, regular monitoring

Doctor Section

Doctor Notes	Prescription	Follow-up Instructions
MRI analysis suggests presence of pituitary tumor with confidence 90% and estimated stage Grade IV. The image processing pipeline identified 1 red boundary contour outlined on the original MRI. Clinical correlation with symptoms and specialist review is recommended.	• Recommend corticosteroids to reduce edema if clinically indicated, together with symptom-guided supportive care and further contrast-enhanced neuroimaging review.	• Follow-up MRI in 4-6 weeks. Neurosurgery or neurology consultation is advised, with earlier review if symptoms worsen.
