

Clinical Imaging Report

Patient Information

Patient Name satyam shamrao jondhale	Patient ID 7
Age 22	Gender Male

Scan Details

Detection Type	Brain Tumor
Study ID	20260411050958920630_of26452d
Model Accuracy	66.67%
Status	Approved

AI Summary

Detection Status	Detected
Tumor Type	pituitary tumor
Tumor Stage	Grade IV
Tumor Confidence	86%
Alzheimer Stage	NonDemented
Alzheimer Confidence	0%

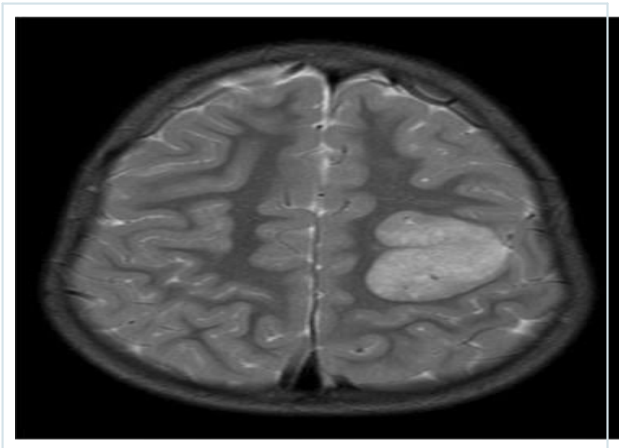

Segmentation Summary

Mask Quality	Clear
Contour Count	1
Tumor Area	3.78%
Tumor Area (mm2)	5332 mm2
Tumor Volume	5332 mm3
Bounding Box	92 x 76 px

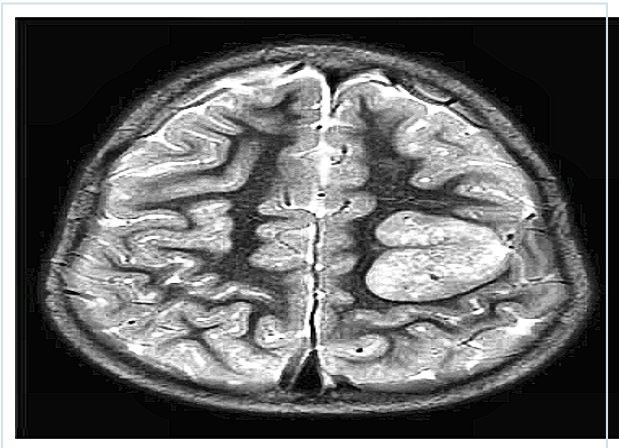

Bounding Box (mm)	92 mm x 76 mm
Tumor Pixels	5332

Clinical Interpretation

AI analysis identified a large focal lesion pattern consistent with pituitary tumor. Estimated tumor occupancy is 3.78% of the image field. Findings should be correlated with the complete radiology study and clinical assessment.

Clinical Notes

Doctor Notes	Prescription	Follow-up Instructions
MRI analysis suggests presence of pituitary tumor with confidence 86% and estimated stage Grade IV. The image processing pipeline identified 1 red boundary contour outlined on the original MRI. Clinical correlation with symptoms and specialist review is recommended.	• Recommend corticosteroids to reduce edema if clinically indicated, together with symptom-guided supportive care and further contrast-enhanced neuroimaging review.	• Follow-up MRI in 4-6 weeks. Neurosurgery or neurology consultation is advised, with earlier review if symptoms worsen.

This AI-generated report is a decision-support artifact only. Final diagnosis, treatment, and patient management must be determined by a qualified clinician after full radiological and clinical review.
